Early in 1958, instruments on the space satellites Explorer I and Explorer III revealed the presence of radiation belts, enormous populations of energetic particles trapped in the magnetic field of the earth. Originally published in 1983 but long out of print, "Origins of Magnetospheric Physics" tells the story of this dramatic and hugely transformative period in scientific and cold war history. Writing in an accessible style and drawing on personal journals, correspondence, published papers, and the recollections of colleagues, space pioneer James Van Allen documents a trail-blazing career in space history. "Origins of Magnetospheric Physics" was his first book; for this paperback edition he wrote a new preface to introduce his "tale of curiosity, exploration, and discovery" to another generation of readers.

A Milestone in Scientific History

By Matthew A. Bille

James Van Allen passed away in August 2006, leaving an awesome legacy of achievement. This slender, well-written volume describes the progress in atmospheric and space physics with a focus on Van Allen's crowning achievement: his detection of the high-energy radiation belts around the Earth. The Van Allen belts were found by particle detectors prepared by Van Allen and his associates at the University of Iowa and carried aloft on the early Explorer satellites of 1958.

Van Allen continued his work in physics and space science up until his death at age 91. He assisted greatly in the researching of the book I co-authored, *The First Space Race*, which told the story of the earliest satellites. *Origins of Magnetospheric Physics* tells an accessible, compelling story of scientific discovery.
